

FACILITATOR FIELD GUIDE

ChatGPT for Teachers

A workshop operating guide for safe, useful and critical teacher practice.

Training is not permission. Do not use real student, parent, colleague, safeguarding, SEN, health, grade or unpublished assessment data in a personal or unapproved ChatGPT account.

What strong delivery looks like

- Teachers practise, not just watch.
- Every impressive output is followed by a verification move.
- The presenter distinguishes a privacy setting from school approval.
- Short courses teach a curated live route; the rest is reference material.
- The session ends with one safe workflow, one deliberate boundary and one 30-day action.

15-minute pre-flight

15 minutes before

- Open the exact ChatGPT account/workspace you will demonstrate.
- Verify current labels for Data Controls and Memory on that account.
- Open Projects, Plugins and Study Mode once; plan/workspace/rollout can differ.
- Browser at 100% zoom; close personal tabs; enable Do Not Disturb.
- Check projector readability from the back row.

10 minutes before

- Open a test room and scan the QR from a phone on cellular data.
- Advance two slides and send a synthetic test booklet.
- Confirm it reaches the presenter; end and delete the test class.

5 minutes before

Put the safety boundary on screen before participants open ChatGPT.

- Know the local privacy/IBP/DPO contact.
- Know the local safeguarding route.
- Keep the offline fallback ready.

The safety spine

GREEN	AMBER	RED
Public / synthetic / non-personal inputs; low-stakes drafting; teacher verifies.	Internal materials, parent/staff communication, assessment support, connected apps, uncertain approval. Stop and check policy/data scope.	Named/sensitive student information, safeguarding, health/SEN, passwords, unpublished high-stakes tests, emotion inference or consequential AI decisions.

Five questions before every prompt

1. Is this account/tool approved for this school purpose?
2. Am I including a real person or anything sensitive/confidential?
3. Does the tool actually need this information?
4. Could the output materially affect a student's opportunity, assessment, wellbeing or safeguarding?
5. How will I check the output independently?

If you cannot answer those confidently, stop and use the school route.

Facilitation rhythm

1. **Show** - one concept in 60-90 seconds.
2. **Boundary** - one thing not to do.
3. **Do** - participants try a safe synthetic example.
4. **Verify** - participants find one weakness, error or unsupported assumption.
5. **Rewrite** - improve the prompt or output.
6. **Record** - one line in the booklet.

Five demonstrations worth protecting

Bad prompt -> SCOPE-V

Start vague, rebuild with constraints and verification, then compare.

Fluent but wrong

Use a synthetic task with a plausible error; verify independently.

Data boundary

Transform a named/sensitive example into a safe synthetic/minimised prompt.

Resource production

Create an artefact, then run teacher QA for accuracy, curriculum, accessibility, bias and answer key.

Project/workflow

Show stable instructions plus approved reference material; never use Projects as a student-work dump.

When to escalate instead of improvise

- Can I upload our student list / IEP / OPP / SEN plan?
- Can AI grade this summative or decide a student's level/stream?
- Can I paste a safeguarding disclosure?
- Can we connect school Drive/email/classroom to a personal account?
- Does switching off model training make the tool school-approved?

Answer the principle, then hand off the implementation decision to the school's DPO/IBP/safeguarding/assessment route.

Incident response

1. Stop - do not paste more information.
2. Record only what is needed to report the incident; do not spread sensitive content in screenshots.
3. Use the school incident/data-breach route immediately.
4. For safeguarding content, use the safeguarding route immediately.
5. Follow deletion/provider actions only as instructed; do not assume deletion erases every legal/retention issue.

Failure plan

If phones cannot join

- Continue in solo/projector mode.
- Participants use paper/notes for booklet prompts.
- Do not improvise data collection through personal email or WhatsApp.

If ChatGPT is unavailable

- Rewrite a vague prompt into SCOPE-V on paper.
- Classify six use cases Green/Amber/Red.
- Red-team a prewritten output for unsupported claims, bias, curriculum mismatch and missing verification.

The learning objective is teacher judgement, not service uptime.

Closing and certificate

1. What will you try?
2. What will you deliberately not put into ChatGPT?
3. Name one verification habit.
4. Submit the closing booklet and 30-day action.

Certificate standard

The certificate records completion/participation. It is not OpenAI certification, legal accreditation, school approval or proof of independent competence.

Recommended evidence: core safety classification, one SCOPE-V prompt, one verification/error-hunt, closing takeaway and 30-day action.

Current-source rule

Re-verify volatile product claims on the workshop day. The full source register is included in the ZIP.
